AUTHOR: Lushnikova, Z.M.

SOV/140-58-2-18/20

TITLE: On Monotony of Solutions of Systems of Differential Equations  
(O monotonnosti resheniy sistem differentsial'nykh uravneniy)PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy Ministerstva vysshego  
obrazovaniya SSSR, Matematika, 1958, Nr 2, pp 210-218 (USSR)

ABSTRACT: The author considers the system

$$(1) \quad \frac{dx_i}{dt} = X_i(x_1, x_2, \dots, x_n)$$

with continuously differentiable right sides; let  $X_i(0, 0, \dots, 0) = 0$ .Let  $p(x_1, \dots, x_n)$  be a point of the phase space. The trajectory  
 $f(p, t)$  which in the moment  $t = t_0$  leaves the point  $p$ , is called  
monotone in  $x_1$  if on it for all  $t \geq t_0$  the conditions  $x_1 > 0$ , $\frac{dx_1}{dt} < 0$  are satisfied and if  $f(p, t) \rightarrow 0$  for  $t \rightarrow +\infty$ . An open  
domain  $G$  which is filled up of trajectories monotone with respect  
to  $x_1$ , is called a domain of monotony with respect to  $x_1$ .Theorem: If in a certain domain  $G$ , which joins the origin, a  
positive function  $V(x_1, \dots, x_n)$  can be given, the derivative

Card 1/2

On Monotony of Solutions of Systems of Differential Equations

SOV, 140 .58-2-18/20

$\frac{dV}{dt} = \sum \frac{\partial V}{\partial x_i} \cdot x_i$  of which is negative; if  $V(p)$  increases unlimitedly, if  $p$  approaches the boundary or if  $\sum x_i^2 \rightarrow \infty$ ; if in  $G$  besides  $x_1 > 0$  and  $\frac{dx_1}{dt} < 0$ , then  $G$  is a domain of monotone stability in  $x_1$ .

In a certain sense the second theorem is the reversion of the first one.

The third theorem asserts that for the appearance of small disturbances also the domain of monotony changes little. There are 5 Soviet references.

TITLE:

On the Question of the Variation of the Region of Monotony

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy. Matematika, 1959,

Nr 6, pp 96-101 (USSR)

ABSTRACT: In her preceding paper [Ref 1] the author gave necessary and sufficient conditions that the solutions of

(1)  $\frac{dx_i}{dt} = x_i(x_1, x_2, \dots, x_n) \quad (i=1, 2, \dots, n),$   
where  $x_i$  are functions continuously differentiable everywhere in  
 $-\infty < x_i < +\infty$ ,  $x_i(0, 0, \dots, 0) = 0$ , are monotone with respect to a coordinate  $x_i$ . In the present paper the author investigates the change of the region of monotony proved in [Ref 1] for the transition to the corresponding system of difference equations

and for the introduction of a delay.

Theorem 1: Let the system (1) stable in the large be monotone in  $G$  with respect to  $x_1$ . Then for all given  $\varepsilon$  and  $R$  a number  $\delta > 0$  can be determined so that the system06312

AUTHOR: Lushnikova, Z.M.

TITLE: On the region of monotony of some nonlinear differential equations

PERIODICAL: Referativnyy zhurnal. Matematika, no. 7, 1960, 86.  
Abstract no. 7574. Tr. Ural'skogo politekhn.in-ta, 1958,  
sb.74, 46-52

TEXT: The author considers systems of differential equations obtained with the arrangement  $\dot{x} = y, \dots$  from the equations  $\ddot{x} + ax + f(x) = 0$ ,  $\ddot{x} + \varphi(x) + bx = 0$ ,  $\ddot{x} + \varphi(x)x + bx = 0$ ,  $\ddot{x} + ax + b\dot{x} + f(x) = 0$ , and being equivalent to them. The following definitions are formulated: An arbitrary solution of such a system is called monotone with respect to the function  $V = \frac{x^2}{2}$  if the timely derivative  $dV/dt$  calculated along this solution is negative. The open region  $G$  filled with trajectories of the system being monotone with respect to  $V$  is called the region of monotony of this system. For such an interpretation of the monotony and the region of monotony the results of the paper are not valid since for all considered equations "regions of monotony" are constructed which,

Card 1/2

C111/C222

✓

On the region of monotony...

beside of the whole trajectories of the system, contain also their positive semitrajectories. If in the given definition of monotony the word "solution" everywhere is replaced by "positive semitrajectory", and in the definition of the region of monotony the word "trajectory" is replaced by "positive semitrajectory" then one obtains definitions to which there correspond the conditions for the existence of regions of monotony given in the article. These conditions consist of certain restrictions for the defining quantities of the above equations; regions of monotony of the corresponding systems are constructed. Here it always is proved that at least those positive semitrajectories of the system which belong to the region of monotony are  $O^+$ -curves. Thus the published results are a further development and especially a detailed performance of the idea of A.D.Gorbunov (Vestn.Mosk.un-ta, 1951, no.3).

ABSTRACT	: Bokhara bistort is a valuable perennial tannin plant. It is encountered in the wild growing form on the sub-alpine meadows of the mountain range of Tien-As and to a partial extent of the Western Tyan'-Shan'. In cultivation, it grows successfully in the piedmont zone of Alma-Ata Oblast'. It reproduces vegetatively - with pieces of rhizomes weighing 100-300 grams and set out in autumn or spring, or from seeds. In the reproduction from seeds, the sowing is done towards winter, in October-November. The spring sowing of the seeds does not produce sprouts.

ABSTRACT : of the stand of 100 thousand plants on 1 hectare, the yield of the roots in dry form in the 3d year of life, reaches 25 tons in the case of the reproduction from seeds and 32 tons with the vegetative propagation. In spite of the higher yield, the vegetative cultivation of bistort is less profitable owing to the expensive planting material. The maximum amount of tannins (25.25%) is contained in the 3-year old roots of bistort at the budding stage and the beginning of flowering. -- B. L. Klyachko-Gurvich

AUTHORS: Lushpa, R.G., and Rebane, L. A.

TITLE: Effect of silver activator concentration on the spectra  
and yield of alkali-halide phosphors

SOURCE: Akademiya nauk Estonskoy SSR. Institut fiziki i astrono-  
mii. Trudy. No. 14, 1961. Issledovaniya po lyuminest-  
sentsii, 87-110

TEXT: The authors report an investigation and interpretation of  
the changes on spectral characteristics and quantum yield of NaBr:  
Ag, NaCl:Ag and KCl:Ag occurring on increase of the silver content.  
The main results of the work were presented at the Ninth All-Union  
Conference on Luminescence in June, 1960, and a summary was pub-  
lished earlier by L. A. Rebane (Ref. 1: Trudy IFA AN ESSR, no.11,  
193, 1960). This work is a continuation of a similar study by the  
same author of NaCl:Ag with 0.01 - 3.0 mol.% Ag (Ref. 2: Trudy IFA  
AN ESSR, no. 12, 49, 1960). NaCl:Ag and NaBr:Ag were prepared ei-  
ther as monocrystals (by the Czochralski method) or as polycrystal-

Card 1/3

S/613/61/000/014/005/019

Effect of silver activator ...

line ingots (by solidification of melt). Monocrystal series had 0.01, 0.1, 0.3, 0.6, 1.0, 1.3, 1.6, 2.0 and 3.0 mol. % AgBr in melt; polycrystal series had 1, 3, 7, 10, 15, 20, 25 and 30 mol.% AgBr. KCl:Ag phosphors were prepared from KCl and AgCl which were poorly miscible; only the following AgCl concentrations were used: 0.01, 0.1, 1.0 and 3.0 mol.% in melt. Absorption, emission and excitation spectra were recorded. In the case of monocrystals the technique used previously (Ref. 2:Op. cit.) was employed, except that the absorption spectra of NaBr:Ag with 1.3 and 1.6 mol.% AgBr were determined employing Ye. K. Putseyko's technique (Ref. 7: Optika i spektroskopiya, 3, 665, 1957). G. Fonda's method (Ref. 8: J. Phys. Chem., 43, 574, 1939) was used to determine the quantum yield of polycrystals in powdered form. Excitation was obtained from a hydrogen lamp  $\text{BC}\phi\gamma-3$  (VSFU-3) and a monochromator  $C\phi-4(\text{SF}-4)$ . The luminescence and the reflected exciting light were analyzed with the same monochromator SF-4 and a photomultiplier  $\Phi\exists\gamma-18$  (FEU-18). NaBr:Ag is hygroscopic; to keep it dry it was smeared with a thin layer of wax. The principal result of the work was establishment of the existence of three types of luminescence centers ✓

Card 2/3

Effect of silver activator ...

in all the phosphors: Type I (one  $\text{Ag}^+$  ion), type II (two  $\text{Ag}^+$  ions), type III (probably Ag atom). As the concentration of silver increased, type I centers were formed first, then type II and finally type III. In KCl:Ag the presence of one or the other type of center depended on previous heat treatment. Acknowledgment is made to F. D. Klement who suggested the subject and directed the work. There are 14 figures, 4 tables and 27 references: 19 Soviet-bloc and 9 non-Soviet-bloc. The 4 most recent references to the English-language publications read as follows: H. Etzel and J. Schulman, J. PERIODICAL: Referativnyy zhurnal, Fizika, no. 6, 1962, 54, abstract 6V374  
("Tr. In-ta fiz. i astron. AN EstSSR", 1961, no. 14, 87 - 110,  
English summary)

TEXT: The changes of spectrum characteristics and radiative quantum yield of crystal phosphors on NaBr, NaCl, and KCl base when activated by Ag in different concentrations have been investigated. In the case of low Ag concentrations, the centers containing one  $\text{Ag}^+$  ion are responsible for luminescence. At an increase of the activator concentration, luminescence centers appear which contain two  $\text{Ag}^+$  ions, and the radiative quantum yield of centers of the former type drops so much that the sum of the quantum yields of the two centers remains constant. One more type of centers, the nature of which has not been studied, has been discovered at high Ag concentrations.

TOPIC TAGS: welding, fusion welding, fracture welding, through-hole welding, casing welding, high-pressure device, steel, 25Kh3NM steel, tensometry, magnetic defectoscopy, ultrasonic defectoscope

ABSTRACT: The experimental study of fracture welding and through-hole welding of steel 25Kh3NM made it possible to determine the most effective method for repairing heat exchangers and reactors. Simple fractures were repaired by the standard methods of fusion welding while the through-holes of large diameter were filled with plugs made of the same steel as the objects to be repaired, and were welded with Kh3M electrodes at 250-300C. This technique resulted in the appearance of cracks in the inner surface of the objects due to the greater hardness of welded areas. No cracking was observed when the steel 25Kh3NM sublayers were substituted for the plugs. The metal was preheated to the required temperature

Card 1/2

ACCESSION NR: AP4027224

by electrical heaters placed inside the objects, which were subsequently heat-treated in a gas oven. The repaired casings were tested by magnetic and ultrasonic defect-detection devices, and the structure of the welds was studied in polished sections. The repaired heat exchangers were also subjected to tensometric tests at 20-cycle loading. The maximum hydraulic pressure applied was 500 atm (actual expected pressure is 320 atm). No defects were observed after the tests. Orig. art. has: 4 tables and 3 figures.

TOPIC TAGS:	high pressure vessel, welded vessel, multilayer vessel, prestressed vessel, vessel property			
ABSTRACT: Results are presented of the theoretical and experimental investigation of the prestressed state and strength of a welded, multilayer, high-pressure vessel made at the Irkutsk Division of the NIIKhimmash in 1964. The vessel shell was made of three sections, 1100, 1000 and 900 mm long, arc welded together along the circumference. Each shell section consisted of a central carbon steel pipe, 300 mm in diameter, and 7 close fitting steel jackets welded from prestretched, 6-mm steel sheets pressed tightly over the central pipe and each successive jacket. The steel had a tensile strength of 40 kg/mm <sup>2</sup> and a yield strength of 25 kg/mm <sup>2</sup> ; the vessel was designed for a working pressure of 290 kg/cm <sup>2</sup> . In hydrostatic pressure tests, plastic failure without fragmentation occurred at a pressure of 775 kg/mm <sup>2</sup> , forming a longitudinal crack, 1300 mm long and 184 mm <sup>2</sup> . The circumferencial welds made by automatic multilayer welding had a strength equal to that of the multilayer sections.

Lusin, N., et Kouznetzoff, P. Sur l'invariabilité absolue  
et l'invariabilité à « près dans la théorie des équations  
différentielles. II. C. R. (Doklady) Acad. Sci. URSS  
(N.S.) 51, 335-337 (1946).

Consider the system of differential equations

$$(I) \quad \sum_{i=1}^n a_{ij}x_i = b_j f(t), \quad i = 1, \dots, n,$$

where  $a_{ij}$  is a polynomial with constant coefficients and of  
second degree in  $D$ .  $b_1 = b_2 = \dots = b_n = 0$ . The  
function  $f(t)$  is assumed analytic. It is shown that  
 $\Delta(D) = |a_{ij}|$  is not identically zero. In paper I it is proved

function  $f(t)$  is continuous and bounded on  $-\infty < t < \infty$ . In paper I it is proved that the vanishing of the minor of  $a_{11}$  in  $\Delta$  is a necessary and sufficient condition for  $x_1(t)$  to be independent of the function  $f(t)$ . If the first  $2n-2$  derivatives of  $f(t)$  are bounded on  $-\infty < t < \infty$  and if the real parts of the roots of  $\Delta(\alpha) = 0$  are all negative, paper II shows that the system (1) has only one bounded solution on this interval. If  $E_1(t), \dots, E_n(t)$  represents this bounded solution, and  $x_1(t), \dots, x_n(t)$  represent any other solution of (1), then for every  $t > 0$  there exists a  $C$  such that  $|x_i(t) - E_i(t)| < C$ ,  $i = 1, \dots, n$ .

Zasht. Bilja [Plant Prot., Beograd], 1952, 12, pp. 18-29, 1952. [English summary.]

In studies at the Institute for Plant Protection, Zagreb, on the biology and control of maize head smut (*Sorosporium reiliana*) [*Sphacelotheca reiliana*; see above, p. 280 and R.A.M., 28, p. 120] the chlamydospores of the fungus were found to be ripe after a resting period of three to four months and 5 to 20 per cent. began to germinate in February and March, but the majority started in April when temperatures were higher. With the aid of the Reed, Swabey, and Kolk infection method [6, p. 548], the optimum temperature for infection of maize seedlings was

TITLE: Study of the radioluminescence of alkali halide crystals in the horizontal channel  
of a reactor.

SOURCE: AN LatSSR. Institut fiziki. Radiatsionnaya fizika, no. 1, 1964. Ionnye  
krystally\* (Ionic crystals), 3-13

TOPIC TAGS: alkali halide crystal, radioluminescence, nuclear reactor, neutron bombard-  
ment, thermoluminescence, thallium activator

ABSTRACT: The purpose of this work was to study the intensity of radioluminescence, the  
kinetics of the flare-up of radioluminescence, and the thermoluminescence of the crystals  
KC1-Tl, KBr-Tl, KI-Tl, and CsI-Tl in the range 300-600K excited by radiation from the  
horizontal channel of an IRT reactor. The x-ray luminescence of these crystals was also  
investigated. The flux used at the exit of the channel was  $6 \times 10^8$  n/cm<sup>2</sup> · sec. for thermal  
neutrons, 10,000 rad/hr. for fast neutrons, and 7800 rad/hr. for gamma rays. The ther-  
mal capacity of the reactor was 1500 kW. It was found that the contribution of thermal  
neutrons to the radioluminescence was negligible, and that the luminescence intensity was

Card 1/2

2

proportional to the total dose of fast neutrons and gamma rays. Radioluminescence and thermoluminescence differed only slightly at temperatures above room temperature, and hence the processes of energy transfer from the base substance (alkali halide) to the activator (thallium) also differed slightly under the excitation conditions studied. Orig. art. has: 10 figures.

Determination of the feeding value of meadow hay and aftermath based on botanical and chemical analysis. A. ZARTSCHEK AND B. J. CSIKI. *Kühlteigyi Közlemények* 32, 461-01(1929).—Feeding values of a no. of grasses for various animals are discussed. The digestibility of fiber-free org. matter of hay by horses is 5-13% lower than in the case of ruminants. The N-free extractives, crude fiber and fat were less easily, and the protein more easily, utilized by horses than by ruminants. The amide content of hay is not characteristic of its quality, but depends on the period of cutting. B. C. A.

ASH-SLA METALLURGICAL LITERATURE CLASSIFICATION

The nutritive value of leaves and stem of Jerusalem artichoke. - Bella-Luske. *Klin. Woch.* 37, 57-62 (1926). - Jerusalem artichoke cut before ripening of its tubers yields a very good hay. A hay sample cut in June contained 16% H<sub>2</sub>O and 1.07% digestible protein. Its fodder value was 45.6 (starch value). Yield of tubers is, however, much lowered by such early cutting. Leafy stems cut in December after full ripening of tubers contained 50.54% H<sub>2</sub>O and 0.36% digestible protein, and had a starch value of 10.8. Most of the carbohydrates are found in the stems rather than in the leaves. N compds. occur chiefly in the leaves. Total water-sol. carbohydrate was in the June plants 36.02% (as invert sugar) against 20.95% in the December plants. Contents of direct reducing sugars were 7.57 and 14.50, resp., inulin 13.90 and 1.98%, sucrose 14.95 and 12.50% and pentosans 7.04 and 10.12%. S. S. de Finally.

Investigation of the feed value of extracted meal grits. Béla Láska (Hungarian Chem. Inst. and Central Expt.-Stat., Budapest, Hungary). *Kürtöslényi Kézirat*, 46, 30-45 (1943).—About 20 samples were investigated. The min. and max. values obtained calcd. from substance contg. 11% moisture were: ash 4.3-8.8, org. matter 80.1-84.7, crude protein 17.0-50.2, pure protein 16.9-48.9, crude fat 0.7-4.2, and crude fiber 8.0-37.7%. The approx. content might preferably be estd. on the basis of crude protein and fat content. Grits contg. 40.4% crude protein show 34.6% digestible protein and 52.1% starch value, grits contg. 31.5% crude protein show 28.4 and 45.0, and grits contg. 23.5% crude protein 16.8 and 30%, resp. The following method for estn. is proposed. Only the content of crude protein must be detd. If this is above 31.5%, then the difference must be multiplied by 0.8 and the result added to 45.0 (starch value of grits of 31.5% crude protein content) to obtain

the starch value of the investigated grits. If the crude protein content is below 31.5, then the difference must be multiplied by 1.8 and the result subtracted from 45.0 to obtain the approx. starch value of grits. All samples were of Hungarian origin. István Pintál

"Vibration Pile Drivers With a Sprung Additional Load," O. A. Savinov, Cand Tech Sci, and A. Ya. Luskin, Engt VNIIGS Mmashstroy

"Byul Stroit Tekhn" No 15, pp 24-26

Describes new improved pile driver, consisting of two major parts, vibrator and additional load interconnected by spring device. Design permits increase in driving force without reduction of vibration intensity. States advantages of new design, namely, possibility of installing electric motor on additional load, resulting in

243T34

improving its performance, since this load is not subjected to vibrations; use of electric motors with phase rotors which have optimum starting quality; elimination of shock-absorbing device for operation of extracting piles. There are 2 types of pile driver: VPP-1, designated for sinking pipes used in building concrete or sand piles, and VPP-2, for sinking and extracting sheet piles. Tests showed that driver sinks pipes and piles up to 325 mm in dia to depth not less than 16 m with speed in 1-6 m/min range.

(USSR)

ABSTRACT: In the present paper the method of "wet combustion" for the simultaneous determination of carbon, halogens, and nitrogen in organic substances is employed. The weighed-in portion of the substance is burned by wet combustion at 150 - 160° with a mixture of concentrated sulfuric acid and a concentrated aqueous solution of chromic acid. The duration of combustion does not exceed 30 minutes. The gaseous oxidation products formed are led by means of an oxygen current through a quartz tube heated to a temperature of 700 - 750° and charged with a catalyst (chromous oxide on pumice stone). Carbon is oxidized to CO<sub>2</sub>, which is adsorbed on ascarite and weighed out. The halogens are isolated in the elementary state or in form of hydrogen halides. They are absorbed in an acetic acid solution of hydrazine hydrate (p<sub>H</sub> 6) and are argentometrically

titrated according to Volhard. Nitrogen is determined after combustion as ammonia from an alkaline solution. Together with carbon, halogens and nitrogen, also iron, copper, silicon, and other elements can be determined which are turned into salts by oxidation and are left over in the sulfuric acid solution. The method worked out in this paper is of interest especially for industrial laboratories. It is possible to analyze not only dry substances but also solutions of organic compounds in water or sulfuric acid. An apparatus suited for carrying out determination is illustrated and described. Determination itself is also described in detail. The results obtained by a number of determinations carried out by this method are given. Accuracy is satisfactory. Also silicon-organic substances can be analyzed in this manner. There are 1 figure, 6 tables, and 7 references, 3 of which are Soviet.

TITLE:

Analysis of Used up Copper-silicon Alloys (Analiz otrabotannykh  
kremnemednykh splavov)

PERIODICAL:

Zavodskaya Laboratoriya, 1959, Vol 25, Nr 3, pp 288 - 289  
(USSR)

ABSTRACT:

The Cu/Si alloys used according to the synthesis of alkyl- and arylchlorosilanes (up to 20% Cu and 80% Si) consist, after being used up, of free silicon, metallic Cu, and admixtures of carbon and metal chlorides (Ref 1). The determination of C, Cl, Si, Cu, and Fe (from a weighed portion) according to the method of "wet" burning is described. The weighed portion is heated in the oxygen current with concentrated sulphuric acid and chromium oxide. The oxidation products enter a quartz tube heated to 700-750°, filled with chromium oxide where a complete decomposition takes place. The chlorine and hydrogen chloride synthesized is absorbed in the hydrazine hydrate. The metals remain in the reaction flask as sulphates. Si, SiO<sub>2</sub>, and SiC

do not dissolve and can be weighed together. Copper is separated from iron by use of sodium sulphide and iodometrically titrated. The remaining iron may be titrated as Fe(II) with potassium bichromate in the presence of diphenylamines. A precise course and the results of analysis (Table) are mentioned. Duration: 2.5 - 3 hours. There are 1 figure, 1 table, and 2 Soviet references.

TITLE: Determination of the Carbon Content in Silicon - Copper Melts

PERIODICAL: Plasticheskiye massy, 1960, No. 5, pp. 65-66

TEXT: This paper describes a method of determining the carbon content in silicon - copper melts, used for the synthesis of alkyl- and aryl chlorosilanes. After synthesis the melts contain up to 20% C. This carbon content is characteristic of the degree of exploitation of the melt. The following data are given for its determination: weighed portion of the melt 0.1 - 1.5 g, addition of 10 ml of concentrated  $H_2SO_4$  free from organic impurities, addition of 2 - 3 ml of chromic acid, and heating to 150 - 160°C in pure oxygen current (50 - 60 ml/min). The oxidation products are heated in a porcelain tube containing chromium oxide on pumice to 700 - 750°C, and subsequently passed through different solutions to absorb their components: hydrazine hydrate brought to pH = 6 with acetic acid (absorption

of chlorine compounds), concentrated sulfuric acid (absorption of water),  
and a tube filled with Anhydronite and Ascarite, in which CO<sub>2</sub> is adsorbed.

The analysis takes 30 minutes. N. G. Korovina made a comparison with other  
methods of analysis, and obtained good agreement. There are 1 figure,  
2 tables, and 4 references: 3 Soviet and 1 British.

TITLE: Organic Elemental Analysis by the Wet Ashing Method.  
Report II. Rapid Determination of Silicon in Organic  
Silicon Compounds

PERIODICAL: Zhurnal analiticheskoy khimii, 1961, Vol. 16, No. 1,  
pp. 83-86

TEXT: In the present work, a rapid method for determining silicon in organic silicon compounds was developed. It is based on the previously (Ref. 1) used method of ashing organic or elemental-organic compounds by oxidation with a chromic-acid/sulfuric-acid mixture at 150°-160°C. The silicic acid residue is filtered off (Ref. 3), dissolved in concentrated alkali solution and finally analyzed for silicon by titration according to Šir and Komers (Ref. 5). The determination requires 1.5 h. In analysis of ethoxy- or chloro silanes (containing no radicals) heating with the acid mixture is unnecessary, since these compounds readily hydrolyze in aqueous alkali with formation of sodium silicate, which simplifies the

procedure and reduces the time for one determination to 30 min. The method was tested with a number of pure organosilicon compounds (Table 1) and used for the determination of silicon in industrial ethyl polysiloxanes. The analytical results are in good agreement (Table 2) with the data obtained by the conventional method (Ref. 4). Examples of silicon determination without previous oxidation are listed in Table 3. In this case, the weighed samples were hydrolyzed with a 15% sodium hydroxide solution in a polyethylene vessel. In this type of compound, silicon and the hydrogen bound to silicon can be determined simultaneously in the same weighed sample (Ref. 7). The analyses were carried out by L. M. Kharchevnikova. A. P. Kreshkov and G. D. Nessonova are mentioned. There are 3 tables and 7 references: 6 Soviet and 1 Czechoslovakian.
